Abstracts

Compact FTIR (Fourier Transform Infrared) spectrometers are benchtop or portable analytical instruments that use infrared spectroscopy to identify and quantify chemical compounds in solid, liquid, or gaseous samples by measuring the absorption of infrared light at different wavelengths. These devices are characterized by their smaller size, simplified operation, and lower cost compared to traditional laboratory FTIR systems, while retaining core functionalities such as rapid scanning, high resolution, and spectral accuracy. They typically incorporate Michelson interferometers, advanced detectors like DTGS or MCT, and user-friendly software for real-time analysis, making them suitable for field applications, quality control in manufacturing, educational use, and routine research where space and operational complexity are constraints.

The global Compact Ftir Spectrometer market size was estimated at USD 240.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
