Abstracts

Compaction grouting is a specialized geotechnical construction technique used to densify loose soils and mitigate settlement by injecting a low-slump, mortar-like grout under high pressure into the subsurface, displacing and compacting the surrounding soil matrix without permeating its pores; this process increases soil density, improves bearing capacity, reduces liquefaction potential, and stabilizes ground conditions beneath existing structures, infrastructure, or in preparation for new construction, making it distinct from permeation or fracture grouting methods.

The global Compaction Grouting Service market size was estimated at USD 1240.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
