Abstracts

Composite decking material refers to a manufactured building product designed for outdoor decking applications, combining wood fibers or other natural materials with synthetic polymers, primarily polyethylene, polypropylene, or polyvinyl chloride, to create a durable, low-maintenance alternative to traditional wood decking. Unlike purely plastic or wood options, composite decking integrates the aesthetic appeal of natural wood grain textures and colors with enhanced performance characteristics such as resistance to moisture, rot, insect damage, fading, and staining. Available in various profiles, including solid, hollow, or capped designs, it often features a protective polymer shell in capped composites for added durability and ease of cleaning. The material is engineered to withstand harsh environmental conditions while requiring minimal upkeep, eliminating the need for regular sealing, painting, or staining associated with wood decks.

The global Composite Decking Material market size was estimated at USD 5120.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
