Abstracts

Composite Film Carbon Plate refers to a lightweight, high-performance material constructed by embedding carbon fiber layers within a polymer matrix—typically epoxy or thermoplastic—to form a thin, rigid, and exceptionally strong composite sheet. This material leverages the superior tensile strength and stiffness of carbon fibers while benefiting from the protective and binding properties of the matrix, resulting in a product characterized by its high strength-to-weight ratio, corrosion resistance, fatigue endurance, and design flexibility. It is engineered for applications demanding structural reinforcement without added mass, such as in aerospace components, automotive body panels, sporting goods like rackets and bicycle frames, industrial machinery parts, and even consumer electronics enclosures, where durability and minimal weight are critical.

The global Composite Film Carbon Plate market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
