Report Overview

The composite grinding machine is mainly centered on a circular table, and there are different grinding heads distributed around it. The main structure has a turret column that can be rotated 360°, and the grinding head is installed on different faces of the turret. This structure is relatively compact, but difficult to manufacture. In addition, the column that is connected with the beam by the whole casting has good rigidity, which is conducive to improving the processing accuracy and is suitable for the use of medium-sized machine tools. Some use vertical shaft circular table double column gantry structure, the beam is equipped with drag plate and grinding head, generally suitable for large machine tools. The composite means are diversified, and the machine tool adopts the modular design principle, which can combine different kinds of grinding heads and devices using other metal processing means to form a variety of composite machine tools. Advanced components are used to develop towards grinding centers and machining centers. The machine tool will adopt a grinding wheel exchange device, a tool exchange device, a manipulator, and an automatic measuring device to form a more integrated composite machine tool. The composite grinding machine can complete the compound grinding processing of the inner circle, outer circle, end face and cone surface of the parts through one clamping. It has the characteristics of rate, high precision and easy operation. The combination of the machine tool is strong, and it can install the functional parts such as the grinding wheel library, the exchange table, the automatic measuring system and the manipulator, and it is easy to realize automatic production. At the same time, due to the small clamping force of the vertical arrangement, the fixture is relatively simple, the floor area is small, and the acquisition cost of equipment is saved.
