Abstracts

Composite Interference Screws are specialized medical implants utilized predominantly in orthopedic surgeries, especially for the fixation of soft tissue grafts during procedures like anterior cruciate ligament (ACL) reconstruction. These screws are fabricated from a combination of bioresorbable polymers, such as polylactic acid (PLA), and bioactive ceramics like β -tricalcium phosphate (β -TCP) or hydroxyapatite (HA). This composite structure offers initial mechanical strength to stabilize the graft within the bone tunnel and promotes osteointegration as the materials gradually degrade and are replaced by native bone tissue. The bioactive ceramic components enhance bone healing by serving as a scaffold for new bone growth, while the polymer matrix ensures the screw maintains its structural integrity during the critical healing period. Over time, the screw resorbs, reducing the need for secondary removal surgeries and minimizing potential long-term complications associated with permanent implants. The integration of these materials aims to improve clinical outcomes by facilitating more natural and effective healing processes.

The global Composite Interference Screw market size was estimated at USD 234.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
