Abstracts

Composite Self-lubricated Bearing is an advanced and innovative type of bearing. It is fabricated by combining multiple materials with distinct properties. The matrix material provides excellent load-bearing capacity, while the incorporated additives or lubricating phases endow it with self-lubricating characteristics. During operation, it doesn't require additional lubricating oil or grease. Thanks to its internal special lubricating components, it can effectively reduce the friction coefficient and minimize wear. Even under extreme conditions such as high speed, heavy load, low temperature, or vacuum, it can maintain a stable working state, which significantly extends its service life and cuts down maintenance costs.

The global Composite Self-lubricated Bearing market size was estimated at USD 3729.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
