## Abstracts

Composite wear-resistant plate is a special plate product designed for large-area wear conditions. The matrix is ordinary low-carbon steel or low-alloy steel, stainless steel, etc. with good toughness and plasticity, which provides the plate with comprehensive properties such as strength, toughness and plasticity to resist external forces. The alloy wear-resistant layer is compounded on the surface of the matrix by surfacing, with high hardness and high wear resistance, usually 1/3 to 1/2 of the total thickness. This layer is mainly composed of Cr<sub>7</sub>C<sub>3</sub> carbides with a volume fraction of more than 50%, providing wear resistance and heat resistance that meet the requirements of specified working conditions.

The global Composite Wear-resistant Plate market size was estimated at USD 5827.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
