Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Composites for Wind Energy competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Composites for Wind Energy is a material system with completely new properties, which is composed of two or more materials of different properties through physical or chemical methods on a macroscopic scale. Its core characteristic is that it achieves comprehensive performance that cannot be achieved by a single material through the synergistic effect of the matrix material and the reinforcing material. For example, when glass fiber is combined with synthetic resin, it can withstand tensile stress, resist bending, shear and compressive stress, and form a hard product with a fixed geometric shape. In the field of wind energy, this material system has become the core material for key components such as large wind turbine blades and nacelle covers due to its lightweight, high strength, fatigue resistance, and corrosion resistance, significantly improving the power generation efficiency and operating stability of wind turbines.

The global Composites for Wind Energy market size was estimated at USD 665.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Composites for Wind Energy market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights. It examines market size, competitive landscape, emerging development trends, niche segments, key drivers and challenges, as well as conducts SWOT and value chain analyses.
