Abstracts

Compostability and Biodegradability Testing refers to a systematic scientific evaluation process used to determine whether materials, products, or packaging can safely and effectively break down in natural environments, such as composting systems, soil, or aquatic conditions. This testing ensures that products degrade within a specified timeframe without releasing toxic substances, leaving harmful residues, or negatively impacting the ecosystem. Compostability testing typically assesses biodegradation under controlled aerobic composting conditions, disintegration into small fragments, absence of eco-toxicity, and compliance with standards like ASTM D6400, EN 13432, ISO 17088, and OECD guidelines. Biodegradability testing, in contrast, evaluates how microorganisms convert organic materials into carbon dioxide, water, and biomass under various environmental conditions, such as aerobic soil, anaerobic digestion, or marine water. These testing services are critical for validating environmental claims, supporting eco-label certifications, and helping industries transition toward sustainable materials.

The global Compostability and Biodegradability Testing market size was estimated at USD 1662.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
