Abstracts

Compostable biopolymers are a class of biodegradable polymers derived from renewable biological sources, such as corn starch, sugarcane, or cellulose, designed to decompose into natural elements like water, carbon dioxide, and biomass under specific composting conditions, typically within industrial facilities. These materials are engineered to offer functional properties comparable to conventional plastics while addressing environmental concerns related to plastic pollution and fossil resource depletion, as they break down without leaving toxic residues and support a circular economy by returning nutrients to the soil.

The global Compostable Biopolymer market size was estimated at USD 13250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.80% during the forecast period.
