Report Overview

The global compostable films market is experiencing significant growth driven by increasing environmental concerns, stringent regulations on single-use plastics, and rising demand for sustainable packaging solutions. Compostable films, made from biodegradable materials such as PLA (polylactic acid), PBAT (polybutylene adipate terephthalate), and starch blends, decompose under composting conditions, leaving no toxic residues. These films are widely used in food packaging, agricultural films, and disposable bags, aligning with the circular economy model. Key market trends include advancements in material science to improve durability and barrier properties, as well as collaborations between manufacturers and waste management firms to ensure proper composting infrastructure. Europe leads the market due to strict regulatory frameworks like the EU Single-Use Plastics Directive, while North America and Asia-Pacific are expanding rapidly, fueled by corporate sustainability commitments and consumer preference for eco-friendly products. Challenges include higher production costs compared to conventional plastics and limited composting facilities in developing regions. However, innovations in cost-effective raw materials and increasing investments in waste management are expected to drive long-term growth. Major players include BASF, NatureWorks, Futamura, and Taghleef Industries, who are focusing on R&D and strategic partnerships to strengthen their market position.

The global Compostable Films market size was estimated at USD 271.83 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.25% during the forecast period.
