Report Overview

A composting toilet is a type of toilet that collects and breaks down human waste and creates fertilizer as a by-product. These toilets may have a water line to help flush liquids and solids waste, but in many cases they are dry toilets that take care of waste with bacteria. Users need to manually empty the toilet about once every 3 weeks to 2 months, depending on the frequency of use and the toilet tank capacity. Composting toilets are designed to hold waste in a tank where aerobic bacteria can break down the waste products and create usable fertilizer. They function similarly to a septic system in that they separate the solid and liquid waste to help facilitate the composting process. Keep in mind that the waste will need to be emptied regularly because it does not flow into a septic system or municipal waste system.

The global Composting Toilet market size was estimated at USD 42 million in 2023 and is projected to reach USD 69.17 million by 2032, exhibiting a CAGR of 5.70% during the forecast period.

North America Composting Toilet market size was estimated at USD 12.04 million in 2023, at a CAGR of 4.89% during the forecast period of 2024 through 2032.
