## Abstracts

Compound Levodopa refers to a combination medication that includes levodopa and a peripheral decarboxylase inhibitor (such as carbidopa or benserazide). Levodopa is a precursor of dopamine and is used to replenish dopamine levels in the brain for the treatment of Parkinson's disease. However, when administered alone, a significant portion of levodopa is converted into dopamine in the peripheral nervous system, leading to side effects like nausea and hypotension. The addition of a decarboxylase inhibitor prevents this premature conversion, allowing more levodopa to reach the brain and enhancing its therapeutic effects while minimizing side effects.

The global Compound Levodopa market size was estimated at USD 1669.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
