Abstracts

A compound photodetector is a type of optoelectronic device that is fabricated using compound semiconductor materials, which are composed of two or more elements. These materials, such as InGaAs (indium gallium arsenide), GaAs (gallium arsenide), InAs (indium arsenide), and InSb (indium antimonide), among others, are carefully engineered to possess specific optical and electrical properties. The compound photodetector operates by absorbing incident light photons within a particular wavelength range, depending on the semiconductor composition. When photons are absorbed, they excite electrons in the semiconductor, creating electron-hole pairs. These charge carriers are then separated and collected by the device's electrodes, generating an electrical signal that can be measured and processed. Compound photodetectors are prized for their high sensitivity, fast response times, and ability to detect light in specific spectral regions, such as the short-wave infrared (SWIR) and mid-wave infrared (MWIR) bands. They find extensive applications in various fields, including optical communication systems, where they convert optical signals into electrical signals; remote sensing for detecting objects and analyzing the environment; medical imaging for non-invasive diagnostics; and industrial inspection for quality control and defect detection.

The global Compound Photodetector market size was estimated at USD 192.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.10% during the forecast period.
