### Report Overview

The compressed air produced by the air compressor is generally not pure. Compressed air contains inherent impurities harmful to the final application. Some common pollutants of compressed air are water, dirt, small wear particles, bacteria, and sometimes even degraded lubricating oil. All these impurities are mixed together and often form acid sludge, which may increase the wear of end applications such as pneumatic tools, machinery, valve orifices and electro pneumatic controls such as relays. In order to improve reliability and energy saving, the compressed air must be completely clean and dry.

Compressed air is widely used in different industries and different purposes. Due to different uses, the quality and purity of compressed air are also different. The compressed air standards applicable to the textile industry are quite different from those in the food or pharmaceutical industry, so compressed air post-treatment equipment is required to further treat the compressed air.
