Abstracts

A Compressed Carbon Dioxide Energy Storage System is an emerging long-duration energy storage technology that stores energy by compressing carbon dioxide gas under high pressure and releasing it to generate electricity when needed. During the charging phase, surplus renewable energy powers compressors that convert gaseous CO₂ into a dense liquid or supercritical state, which is stored in insulated tanks. When electricity demand rises, the CO₂ is expanded through a turbine to regenerate power, with the system recapturing and recycling the CO₂ in a closed loop. This technology offers high energy density, low environmental impact, and can be deployed for grid-scale storage, making it a promising solution for balancing renewable energy intermittency and enhancing energy security.

The global Compressed Carbon Dioxide Energy Storage market size was estimated at USD 305.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.00% during the forecast period.
