The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Compressed Cartoon Nebulizers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Respiratory diseases are common in children. Nebulized inhalation therapy is a common method of drug administration used to treat respiratory diseases such as asthma, bronchitis, and pneumonia. It utilizes a nebulizer to transform medication into tiny aerosol particles, which are inhaled through the mouth and nose into the respiratory tract and lungs. Nebulized inhalation therapy is suitable for a wide range of people, including infants and young children with severe illnesses. Nebulizers can be divided into medical and home-use types according to their usage. Medical nebulizers have a more complex structure, higher performance requirements, and a wider range of indications; home-use nebulizers are relatively smaller, more portable, and have simpler functions. Based on different nebulization principles, nebulizers can be divided into three types: compressor nebulizers, ultrasonic nebulizers, and micromesh nebulizers. Among them, compressor nebulizers use compressed gas to propel it at high speed, then suddenly depressurize it as it passes through a narrow opening, creating a localized negative pressure. Simultaneously, they use a siphon effect to expel the liquid medication. When the liquid medication encounters the high-pressure airflow, it is impacted and broken down into aerosol particles, which are then output with the airflow. Ultrasonic nebulizers use ultrasound to cause the liquid medication to vibrate violently, forming fine aerosol particles for atomization. Mesh nebulizers utilize the high-frequency vibration of piezoelectric ceramic plates to force the liquid medication through fine sieve holes, thus producing aerosol particles. In medicine, ultrasonic nebulizers are considered the first generation, compressor nebulizers the second generation, and micro-mesh nebulizers the third generation. From an industry

technology iteration perspective, nebulizers will develop towards more stable spray airflow, adjustable spray rate, and aerosol particle diameters that better conform to human tissue structure. Micro-mesh nebulizers, combining the advantages of compressor and ultrasonic nebulizers, have great future development potential. However, compressor nebulizers are currently more commonly used. Patients using this type of nebulizer can inhale oxygen while simultaneously inhaling medication, effectively relieving hypoxia symptoms. Compressed Cartoon Nebulizers are compact, medical-grade home nebulizers specifically designed for children aged 0-12. They typically feature cartoon designs to reduce children's resistance to treatment. In 2024, global production of Compressed Cartoon Nebulizers reached 3.1483 million units, with an average selling price of \$68.22 per unit. Depending on the device type, low-end products are priced at approximately \$19.16 per unit, mid-range products range from \$49.55 to \$86.89, and high-end products can reach \$170.32 per unit. Gross profit margins range from approximately 42.3% to 73.12%, and downstream customers include major e-commerce platforms and offline pharmacies. With changes in the human living environment and increasing air pollution, the prevalence of respiratory diseases is rising year by year. According to data from the World Health Organization, in 2019, among the top 10 causes of death globally, chronic obstructive pulmonary disease (COPD), lower respiratory tract infections, and tracheal, bronchial, and lung cancer, all related to the respiratory system, ranked third, fourth, and sixth, respectively. In China, approximately 30 million people suffer from asthma, with children accounting for 3.02%; approximately 100 million people suffer from COPD, with patients over 40 years of age accounting for 13.7%. Nebulized inhalation therapy, as a method of drug administration for respiratory diseases, especially bronchial asthma and COPD, has advantages such as rapid onset of action, low dosage, high local drug concentration, and few systemic adverse reactions. With the improvement of people's economic living standards, more and more people are choosing nebulized inhalation therapy.

The global Compressed Cartoon Nebulizers market size was estimated at USD 215.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.20% during the forecast period.
