Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Compressible Thermal Interface Material competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Compressible Thermal Interface Materials (TIMs) are specialized materials designed to enhance heat transfer between two surfaces ? typically between electronic components (like CPUs, GPUs, or power modules) and heat sinks or cold plates. These materials are compressible, meaning they conform easily to surface irregularities when pressure is applied, filling air gaps and minimizing thermal resistance. This property is crucial in ensuring efficient and consistent thermal contact, especially in applications where surface flatness or mechanical tolerances are variable. Compressible TIMs come in various forms such as thermal pads, gap fillers, phase change materials (PCMs), or putty-like compounds, and are often made from silicone, polyurethane, or acrylic bases infused with thermally conductive fillers like ceramic particles, graphite, or metal oxides. Their key benefits include ease of installation, reworkability, and reliable performance under mechanical and thermal stress. These materials are widely used in electronics, automotive, LED lighting, and telecommunications where effective thermal management is essential for performance and longevity.

The global Compressible Thermal Interface Material market size was estimated at USD 533.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
