Abstracts

Compression and Recovery Clothing is clothing that fits tight or snug to the body. It can be made from a variety of materials. Some compression gear is made of nylon or spandex, for instance. Other compression wear has a silicon base. (Compression and Recovery Clothing also sometimes contains a small amount of cotton to help make it softer.) Research suggests that compression gear supports exercise recovery. One way it does this is by improving blood flow. Compressing the blood vessels in the body helps them pump blood more efficiently. This aids in muscle recovery by improving blood circulation to the affected area. Compression gear also contributes to reduced muscle fatigue. Muscle fatigue lessens the force with which the muscle can contract. This results in lower strength performance. By alleviating this fatigue, the muscle is able to better recover. This allows it to push harder in the next workout. One study reports that compression helps prevent fatigue by improving muscle function. Another fitness benefit of compression clothing is increased athletic performance. One study found that compression enhanced recovery past the 24-hour mark. So, its authors concluded that the use of compression gear could enhance next-day performance. (In this case, it was cyclists being studied.) Compression wear also helps limit muscle oscillation. This is when vibration is sent through your body when engaging in movements where your feet hit the ground. Compression garments can help reduce this effect. That's why runners benefit from wearing compression devices such as leggings, tights, or socks.

The global Compression and Recovery Clothing market size was estimated at USD 1317.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
