Abstracts

A compression strut system is a structural load-bearing assembly used in construction and engineering to resist axial compression forces, typically comprising rigid members such as steel or reinforced concrete columns, braces, or supports that transfer vertical or inclined loads to foundations or other structural elements. These systems are integral to frameworks in buildings, bridges, towers, and industrial structures, where they enhance stability, prevent buckling, and distribute weight efficiently, often working in conjunction with tension elements like tie rods or cables within a larger structural scheme to ensure overall integrity and safety under various load conditions.

The global Compression Strut System market size was estimated at USD 475.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
