Report Overview

A CT scan, also known as computed tomography scan, makes use of computer-processed combinations of many X-ray measurements taken from different angles to produce cross-sectional (tomographic) images (virtual 'slices') of specific areas of a scanned object, allowing the user to see inside the object without cutting. Other terms include computed axial tomography (CAT scan) and computer aided tomography.

The innovative cycle of CT is becoming very short as the new and latest technology is being introduced in the market with each being more efficient and faster. There is an increasing trend of high slice CT. The high slice CT scan is expected to improve the clinical utility significantly as the introduction of 256 slice scanner would be having detector width of 10 to 12 cm which would help in scanning an organ, including brain, heart, entire joints, and lungs and liver, in a single rotation. It is also expected to scan the heart with the single heartbeat.
