## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Computer Room Air Handler (CRAH) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The purpose of the Computer Room Air Handler (CRAH) is the same as that of the CRAC device. However, CRAH only uses fans and cooling coils. They typically use a cold water circulation system from a larger unified cooling system, using the same compressor and refrigerant system as CRAC, but with better economies of scale to transfer heat from data center floors to the outside of the building at a lower cost. The CRAH system utilizes cold water and allows for multiple cooling methods to circulate the cooling water. Energy transfer is not directly accomplished on the data center floor, which is why CRAH is referred to as an indirect system. In addition, the different designs of CRAH significantly affect the cooling range, for example, one design can only lower the air temperature by 12 degrees, while another design can lower the air temperature by 23 degrees. Generally speaking, the higher the outdoor temperature, the more powerful equipment is needed. The sales volume in 2024 are approximately 56,000 units, with an average unit price of approximately US\$38,000. The annual production capacity of a single line will be approximately 3,000 units. Upstream companies are mainly suppliers of components such as compressors, heat exchangers, fans, electronic controls and sensors. Downstream companies are mainly data center builders, Internet companies and telecom operators. The gross profit margin is about 20%.

The global Computer Room Air Handler (CRAH) market size was estimated at USD 2128.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.
