Report Overview

In recent years the role of additive manufacturing in the construction industry has become increasingly important. In particular, concrete 3D printers have been continuously gaining popularity among architects and construction firms. After water, concrete is the most widely used substance in the world. Concrete is a composite material that consists of water, cementitious compound, and aggregate (fine and coarse particles of sand, gravel, crushed stone, and similar substances), all of which exist in abundance. As such concrete is an inexpensive, and thus very popular, material. However, concrete 3D printers themselves are expensive. Machines designed for construction tend to be priced anywhere from around \$180k to over \$1M. Nonetheless, there are several benefits of using a concrete 3D printer rather than traditional manufacturing methods. It is faster, cheaper, safer, and more efficient. A concrete 3D printer not only produces minimal waste, but also significantly reduces the number of active participants needed on site as well as the length of supply chains. Moreover, using a concrete 3D printer, construction can be completed to a significantly higher degree of resilience and geometric complexity.
