Report Overview:

Concrete cooling is a technique that reduces the temperature of poured concrete to a certain level, in order to guarantee the quality of the concrete. Concrete cooling is mainly used for projects in parts of the world with warm climates, where large amounts of concrete are used. When concrete cures, a minimum favorable temperature in the range of 10 – 21 °C must be maintained in the concrete for the minimum required curing period. If it cures at temperatures above this level the concrete loses strength, more cracking occurs, it rapidly sets and there is an increased water demand. Therefore, the importance of concrete cooling is huge, especially considering the crucial role concrete plays in almost every building process.

The Global Concrete Cooling Market Size was estimated at USD 999.09 million in 2023 and is projected to reach USD 1206.93 million by 2029, exhibiting a CAGR of 3.20% during the forecast period.
