Report Overview

Shrinkage-reducing admixtures (SRAs) are used to reduce the shrinkage of concrete, whether from drying or self-desiccation. In contrast to other concrete admixtures, they are used in rather large amounts. This is because the interfacial area at which they must act (liquid–vapor) increases radically in the course of drying. Indeed, hardened cementitious materials have large internal surface area, which when covered only by liquid films, provides a very large interfacial area where the SRAs must remain active.
