Report Overview

The condensate removal pump body, as the main component of the condensate pump, is a key structure for accommodating the rotor and stator. The pump body is the basic structure of the condensate pump. Its main function is to provide a closed space in which the rotor and stator can work together to achieve the extraction and transportation of condensate. The pump body is usually made of cast iron, carbon steel and other materials, which have sufficient strength and corrosion resistance to meet the working requirements of the condensate pump in a variety of environments. The pump body is designed with one or more guide grooves to effectively guide the condensed water to the pump outlet to ensure the efficient operation of the pump. The pump body, rotor, stator and other components work closely together to form the overall structure of the condensate pump. The rotor rotates in the pump body, and the rotation of the blades realizes the extraction and transportation of condensed water; while the stator is used to fix the rotor and participate in the operation of the pump.
