Abstracts

Condition - based maintenance solutions for rolling stock are advanced approaches designed to enhance the reliability, safety, and efficiency of trains and related vehicles. These solutions rely on continuous monitoring of various components and systems within the rolling stock using a wide array of sensors. By collecting real - time data on factors like vibration, temperature, pressure, and electrical parameters from parts such as bogies, wheelsets, electrical systems, braking systems, and the train body, maintenance teams can gain a comprehensive understanding of the equipment's condition. For example, vibration sensors on wheelsets can detect early signs of wear or misalignment, while temperature sensors on electrical components can alert to overheating issues. This data is then analyzed, either through traditional methods or more sophisticated data analytics and artificial intelligence algorithms. Instead of following fixed maintenance schedules, maintenance actions are triggered when the monitored data indicates a deviation from normal operating conditions. This allows for proactive maintenance, reducing the likelihood of unexpected breakdowns, minimizing unplanned downtime, and optimizing maintenance costs. It ensures that rolling stock operates at its best, providing a seamless and safe travel experience for passengers and efficient freight transportation.

The global Condition-Based Maintenance Solutions for Rolling Stock market size was estimated at USD 2035.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
