Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Conductive Carbon Materials competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Conductive carbon materials are carbon-based functional materials with tunable structures and excellent conductivity (resistivity 10^{-3} ~ 10^2 Ω cm), including carbon nanotubes (CNTs), graphene, carbon fibers, carbon black, and porous carbon. Their conductivity stems from π -electron delocalization in sp^2 -hybridized carbon atoms, enhanced by doping (nitrogen/sulfur) or compositing (with metals/polymers). Key applications span lithium battery electrodes (e.g., silicon-carbon anodes), supercapacitors, conductive inks, EMI shielding, and flexible electronics. Advantages include high chemical stability, lightweight, and scalable production (CVD, redox methods), though cost (graphene > CNTs > carbon black) and process compatibility vary significantly. The market is driven by new energy (EV batteries, energy storage) and electronics, with conductive additives for batteries accounting for >40% share in 2023. CNTs are replacing carbon black in high-nickel/NCM811 batteries, while graphene gains traction in thermal films (e.g., smartphone cooling). Future trends: 1) Low-cost production (e.g., biomass-derived carbon); 2) Hybrid designs (CNTs-graphene synergy); 3) Recycling for ESG compliance. Challenges include import dependence on premium materials (SWCNTs, few-layer graphene) and price pressure (e.g., 10% annual cost reduction demands from battery makers).

The global Conductive Carbon Materials market size was estimated at USD 2273.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.90% during the forecast period.
