Abstracts

Conductive evaporation boats, also known as ceramic evaporation boats or resistance-heated boats, are specialized ceramic crucibles used in vacuum deposition processes?primarily physical vapor deposition (PVD)?to thermally evaporate materials such as aluminum, zinc, silver, or other metals onto substrates. These boats are composed of refractory materials like boron nitride, titanium diboride, or alumina, often blended with conductive additives to enable direct electrical heating. When an electric current is passed through the boat, it heats up due to its electrical resistance, causing the material placed inside to evaporate and form a thin, uniform coating on target surfaces such as flexible packaging films, electronic components, or optical lenses. Their design ensures precise thermal management, high evaporation rates, and compatibility with continuous industrial processes, making them critical components in industries like packaging, electronics, and solar panel manufacturing.

The global Conductive Evaporation Boat market size was estimated at USD 460.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
