Abstracts

Conductive Fine Particles are micro-sized particles made of high-purity metals, typically ranging from 1 to 20 micrometers in diameter, with excellent conductivity and corrosion resistance. They are widely used in applications such as liquid crystal displays (LCDs), OLEDs, RFID antenna assembly, and flexible electronic devices, enabling efficient electrical connections that meet the demands for high resolution and narrow pitch. As the demand for high-performance electronic components increases, the market for conductive fine particles is rapidly growing, driving the development of smaller and more intelligent electronic devices. Conductive gold particles have the advantages of uniform particle size, high conductivity, suitable elasticity and extremely strong bonding force between the metal shell and the resin core.

The global Conductive Gold Particles market size was estimated at USD 82.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
