Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Conductive Polyimide competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global conductive polyimide market will reach a unit price of \$9,400 per ton, with sales of 460,000 tons. Conductive polyimide is a high-performance engineering plastic modified by the addition of conductive fillers such as carbon nanotubes and graphene. It combines the excellent thermal stability ($>300^{\circ}\text{C}$), mechanical strength, and chemical inertness of polyimide while achieving electronic-grade conductivity (10^2 to 10^4 S/cm). It is widely used in aerospace flexible circuits, semiconductor packaging, and electromagnetic shielding. The global development of conductive polyimides is driven by both technological breakthroughs and expanding demand. With the increasing demand for high-performance materials in aerospace, flexible electronics, and semiconductor packaging, traditional insulating materials are no longer able to meet the stringent requirements for high thermal conductivity, electromagnetic shielding, and dynamic flexing. Conductive polyimides, through nanofiller composite technology, achieve controllable conductivity while maintaining the substrate's high-temperature resistance ($>400^{\circ}\text{C}$) and mechanical strength, becoming a key material for addressing thermal management and signal integrity in cutting-edge electronic systems. Technological evolution is focusing on multifunctional integration and green processes. Next-generation materials will transcend the limitations of single functions and develop towards the synergistic optimization of thermal conductivity, electrical conductivity, and insulation. For example, anisotropic conductive films will be developed to meet the needs of three-dimensional stacked packaging. Furthermore, water-based synthesis processes and bio-based monomer substitution are reducing reliance on toxic solvents in traditional production, aligning with global regulatory trends on the carbon

footprint of electronics products. The maturation of nanofiller self-assembly technology is expected to further lower the percolation threshold and improve material uniformity. The global market is characterized by a multi-polar innovation landscape. European and American companies, driven by aerospace and military demand, dominate ultra-high-reliability products, while Japanese companies dominate high-precision thin films for consumer electronics. China, on the other hand, is accelerating domestic substitution through policy support (such as the "New Materials Special Project," with significant breakthroughs in 5G base station shielding materials and new energy vehicle motor insulation). Future competition will center around customized solutions and cost control capabilities.

The global Conductive Polyimide market size was estimated at USD 4358.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
