Report Overview

Conductometric Particle Counter is a device used to measure the concentration and size distribution of particles in a liquid. It works by passing a liquid sample through a small channel and measuring the electrical resistance of the liquid. As particles pass through the channel, they cause a change in the electrical resistance, which can be used to determine their concentration and size.

The upstream industry chain of Conductometric Particle Counter includes the production and supply of raw materials such as electronic components, sensors, and other materials used in the manufacturing of the device. The downstream industry chain includes the distribution and sales of the device to end-users such as laboratories, hospitals, and industrial facilities.
