Report Overview

Condylar fractures is a result of trauma caused to the condyle, which is a rounded projection of the bone usually meant for articulation with another bone. Treatment and fixation of condylar fractures are challenging owing to various obstacles faced by health care providers and surgeons such as lack of space during surgery and presence of major blood vessels adjoining the surgical site. Condylar plate fixation is a method employed to treat condylar fractures, wherein the surgeon fixes the fracture site with the condylar plate. Condylar plate fixation depends on various parameters such as the level of deformity of the fracture and the type of condylar fracture viz. dislocation, displacement, and deviated fracture. The design and dimension of a condylar plate is selected depending on the specific site of the fracture.
