## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Confocal Spherical Scanning Interferometer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The confocal spherical scanning interferometer is a high-precision optical measurement device built on the principle of multi-beam interference. Its core structure consists of two spherical mirrors with equal curvature radius forming a confocal cavity. When the incident light enters the cavity, it is reflected multiple times in the cavity to form a standing wave field. Only when the light of a specific wavelength meets the resonance condition (the cavity length is an integer multiple of half the wavelength), constructive interference occurs and is transmitted. The piezoelectric ceramic drives the mirror to change the cavity length to achieve wavelength scanning, and finally outputs the interference fringe signal corresponding to the spectrum component of the light to be measured on the photodetector.

The global Confocal Spherical Scanning Interferometer market size was estimated at USD 237.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
