Abstracts

Congenital heart disease (CHD) refers to a range of structural abnormalities in the heart and great vessels present at birth, resulting from errors in cardiac development during the first trimester of pregnancy. These defects vary in complexity and severity, from relatively simple conditions such as small ventricular septal defects that may close spontaneously, to critical malformations like hypoplastic left heart syndrome or transposition of the great arteries, which require immediate medical or surgical intervention after birth. The pathophysiology involves anomalies in heart chambers, valves, or major blood vessels, leading to altered blood flow, pressure imbalances, or reduced oxygen delivery. While some cases are isolated and idiopathic, others are associated with genetic syndromes, maternal health factors, or environmental exposures. Advances in prenatal screening, diagnostic imaging, pediatric cardiology, and surgical techniques have significantly improved detection, management, and long-term outcomes, though CHD remains a leading cause of birth defect-related morbidity and mortality worldwide.

The global Congenital Heart Disease market size was estimated at USD 11570.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.20% during the forecast period.
