Vehicle-to-Everything (V2X) solutions utilize wireless communication technologies (such as C-V2X and DSRC) to enable information interaction between vehicles and other traffic participants (including vehicles, infrastructure, pedestrians, and network platforms). This system comprises an onboard unit (OBU), roadside units (RSUs), communication modules, a cloud platform, and a data processing system. It addresses issues such as information silos, delayed response times, and frequent accidents in traditional transportation systems, improving road safety, traffic efficiency, and autonomous driving capabilities. Gross profit margins average between 35% and 55%. The upstream of the V2X solution industry chain primarily relies on high-performance communication chips (such as 5G and C-V2X), antenna modules, edge computing chips, and sensors such as radar and cameras, as well as embedded operating systems, providing the hardware and software foundation for real-time interaction between vehicles and their external environment. Downstream applications are widely used by automakers, traffic management bureaus, smart city platforms, and logistics companies, driving intelligent upgrades in traffic safety, autonomous driving, and urban management. Future development trends will focus on deep integration with autonomous driving systems to achieve L4 level collaborative perception; edge computing and AI algorithms will improve system response speed; blockchain technology will ensure data security and trusted exchange; and multi-mode communication (5G + satellite + Wi-Fi) will further expand coverage and communication stability, building a more efficient and secure intelligent transportation ecosystem.
