## Abstracts

The controllable flashlight type LED is a kind of audience interaction tool widely used in large-scale events such as concerts and music festivals. The controllable flashlight type LED controlled by the console refers to a high-tech product that uses wireless technology to uniformly control the color, brightness and flashing effect of all the fluorescent sticks on the scene by transmitting signals through the central console. This fluorescent stick has a built-in remote control sensor (chip), which can receive instructions from the console and make corresponding changes according to the instructions, so as to achieve the synchronization effect of the fluorescent sticks in the whole venue. The working principle of the console-controlled fluorescent stick is mainly based on wireless communication technology. The central console sends signals, which are received and decoded by the fluorescent sticks on the scene, and then the fluorescent sticks change their color, brightness and flashing effects according to the decoded instructions. This technology enables tens of thousands of fluorescent sticks in the whole venue to achieve overall color changes at the same time, forming a scene effect that complements each other with stage lighting and live sound effects.
