### Report Overview

Fluid coupling operational principle is the drive wheel and driven wheel are fitted with radial rotor blades and there is no mechanical connection between them. The coupling is filled with a specific amount of fluid (mineral oil or a mixture of mineral oil and water). The main torque generated by the drive machine is converted into operating fluid hydrokinetic energy through a fluid swirl which circulates between the rotor blades in the drive wheel and in the running wheel. This energy is then reconverted into a mechanical torque and conveyed to the driven machine shaft. This report focuses on
