Abstracts

A constant hydraulic pump is a positive displacement pump designed to deliver a fixed, non-adjustable flow rate of hydraulic fluid per revolution, regardless of changes in system pressure (within its operating limits). Unlike variable displacement pumps, which can modulate output to match demand, constant pumps maintain a steady flow, making them suitable for applications requiring consistent fluid delivery, such as in simple hydraulic circuits, lubrication systems, or as charge pumps in more complex arrangements. Their operation relies on mechanical components?such as gears, pistons, or vanes?to move fluid at a predetermined volume per cycle, ensuring reliability and simplicity in systems where flow stability is prioritized over energy efficiency or adaptive control.

The global Constant Hydraulic Pump market size was estimated at USD 1468.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
