## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Constant Temperature Oscillating Water Tank competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A constant-temperature oscillating water bath (also called a constant-temperature oscillator or water bath shaker) is a laboratory device that combines constant temperature control and oscillation functions. It is primarily used for experiments that require uniform mixing, incubation, or reaction of liquid samples at a constant temperature. It consists of a water bath, a heating system, a temperature control system, and an oscillation mechanism. A heating tube heats and maintains the water in the water bath at a set temperature (typically room temperature + 5°C to 99.9°C). Simultaneously, a motor-driven tray performs reciprocating or rotational oscillation to thoroughly mix the liquid within the container. This device is widely used in fields such as bioengineering, cell culture, molecular biology, and environmental testing. It is suitable for constant-temperature oscillation incubation, enzymatic reactions, extraction, and dissolution of samples in containers such as test tubes, flasks, and microplates. It features stable temperature, uniform oscillation, and low noise. In 2024, the global production of constant temperature oscillating water tanks will reach 59,660 units, with an average selling price of US\$1,258 per unit.

The global Constant Temperature Oscillating Water Tank market size was estimated at USD 75.06 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
