Report Overview:

Constrained Layer Damping (CLD) is a system used to suppress vibrations in various machineries such as ship structures, vibrations caused due to propellers, mounted machinery, etc. It is made of two sheets that are rigid, however, have poor damping properties. A damping material such as viscoelastic is placed between the two sheets. When the surface vibrates, it is trapped between the two sheets and degenerated in the constrained layer as sheer energy.

The Global Constrained Layer Damping Market Size was estimated at USD 475.43 million in 2023 and is projected to reach USD 685.94 million by 2029, exhibiting a CAGR of 6.30% during the forecast period.
