## Abstracts

A construction fence screen is primarily used for privacy purposes at construction sites. These fences come in various forms, such as mesh nets made of synthetic fibers or rigid fences made of metal. They are also known by other names such as privacy screens, mesh screens, or wind screens. Fences made from synthetic fibers are often set up using poles or pipes, making them easy to install. They can be stored and transported in rolls, are lightweight, and easy to handle. These screens can also be easily customized to fit different heights and widths. Designed to withstand various weather conditions and on-site demands, they are durable and robust. Since these fences are typically used at construction sites, they are generally considered temporary or provisional fences rather than permanent structures.

The global Construction Fence Screen market size was estimated at USD 1806.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
