Abstracts

Constructional sandwich composites are materials consisting of two outer layers, or facings, bonded to a core material, creating a sandwich-like structure. The facings can be made of materials such as metal, fiberglass, or carbon fiber, while the core material is often a lightweight material like foam, honeycomb, or balsa wood. This combination results in a highly efficient structure with improved strength, stiffness, and durability compared to traditional monolithic materials. Constructional sandwich composites find extensive applications in various industries, including aerospace, automotive, marine, and building construction. They offer advantages such as weight reduction, enhanced impact resistance, thermal insulation, and acoustic damping properties, making them a versatile choice for structural components where strength-to-weight ratio is crucial.

The global Constructional Sandwich Composites market size was estimated at USD 2450.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.15% during the forecast period.
