Abstracts

Semiconductor equipment consumable components are parts that require periodic replacement due to wear, contamination, or performance degradation during wafer fabrication processes. Key examples include:Process chamber components: Showerheads (gas distribution plates), ceramic insulators, and susceptors (wafer holders) in etching (e.g., plasma etchers) and deposition tools (e.g., CVD/PVD).CMP consumables: Polishing pads, diamond conditioners, and slurries (abrasive chemical mixtures) for planarizing wafer surfaces.Ion implantation parts: Ion sources, extraction electrodes, and beamline components exposed to high-energy ion bombardment.Cleaning/drying components: Nozzles, filters, and spin rinse dryers in wet stations.Other wear-prone parts: O-rings, vacuum seals, heaters, and quartzware (e.g., bell jars in epitaxy systems).These components are critical for maintaining process uniformity, yield, and equipment uptime across lithography, etching, deposition, and metrology steps.The development of Consumable Parts for Semiconductor Equipment is closely intertwined with the overall trends in semiconductor equipment. As Moore's Law continues to evolve, the precision and efficiency requirements for chip manufacturing have been consistently escalating, driving continuous advancements in semiconductor equipment technology. This technological progress subsequently enables sustained improvements in chip performance and cost reductions, meeting the growing demand for chip products in the digital economy era. In recent years, despite intensified global trade fluctuations, emerging market demands from artificial intelligence, new energy vehicles, and low-altitude economy sectors have maintained strong global demand for wafer fabrication plant construction. It is anticipated that in the coming years, the global semiconductor equipment industry will continue to experience rapid development, which will further propel the advancement of Consumable Parts for Semiconductor Equipment.
