## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Consumer-grade MEMS Gyroscopes competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of consumer-grade MEMS gyroscopes will reach 376.8 million units, with an average selling price of US\$0.72 per unit. A gyroscope is a device that measures angular rate and is a crucial component of inertial systems. MEMS gyroscopes are devices that measure angular rate. Their core consists of a micromechanical (MEMS) chip, an application-specific control circuit (ASIC) chip, and a stress-isolated package. MEMS gyroscopes have gained widespread application in consumer electronics due to their numerous advantages, including small size, light weight, low power consumption, and low cost. Consumer-grade MEMS gyroscopes typically offer a bias stability (?/h) greater than 15. Consumer-grade MEMS gyroscopes, manufactured using micro-nanofabrication technology, are angular velocity sensors specifically designed to measure the angular velocity of an object rotating about its axis. They offer the advantages of small size and low cost. They are often a key component in an IMU, working alongside other sensors (such as accelerometers) to provide comprehensive information about an object's motion state. An inertial measurement unit (IMU) is a device that measures an object's three-axis attitude angle (or angular rate) and acceleration. An IMU typically consists of a three-axis gyroscope and a three-axis accelerometer to measure an object's angular rate and acceleration in three-dimensional space.

The global Consumer-grade MEMS Gyroscopes market size was estimated at USD 271.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
