Abstracts

A Contact Proximity Aligner is a type of photolithography tool used in wafer fabrication. It is a high-precision tool that is used to align a photomask to the surface of a silicon wafer during the photolithography process. The Contact Proximity Aligner uses a "contact" method, where the photomask is placed directly in contact with the wafer surface. This is in contrast to a "projection" aligner, where the photomask is projected onto the wafer surface through a lens system. The contact method provides higher accuracy and better resolution for transferring patterns onto the wafer. The Contact Proximity Aligner uses a combination of optical and mechanical systems to align the photomask to the wafer. This includes a camera system to image the wafer and photomask, and precision stages to position the photomask in the correct location. The tool is capable of precise alignment, with sub-micron accuracy, allowing for the creation of high-resolution patterns on the wafer. Contact Proximity Aligners are an important tool in the microelectronics industry, as they play a crucial role in the photolithography process and the creation of high-quality microelectronic devices.

The global Contact Proximity Aligner market size was estimated at USD 392.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
