Abstracts

Contactless payment cards are a type of payment card equipped with radio-frequency identification (RFID) or near-field communication (NFC) technology that enables consumers to make secure transactions by simply tapping or waving their card near a compatible point-of-sale (POS) terminal, eliminating the need for physical insertion or swiping. These cards adhere to global standards such as EMV (Europay, Mastercard, and Visa) and operate within a short range (typically up to 10 cm), ensuring both convenience and security through encryption and transaction limits. They are often embedded with a chip that stores encrypted payment information, allowing for quick, efficient, and hygienic transactions, which has accelerated their adoption across retail, transportation, and service industries worldwide.
