Report Overview:

Container Orchestration Software is a type of software that provides automated and simplified provisioning, deployment, networking, scaling, availability, and lifecycle management of containers. Containers are software executables that include application code, libraries, and dependencies so that they can be run anywhere. Containers are lightweight, resource-efficient, and portable, making them ideal for building cloud-native applications. However, managing containers at scale requires automation and coordination, which is what container orchestration software does. Container orchestration software allows administrators to define the desired state of a containerized application using a configuration file, and then schedules and runs the containers on a cluster of hosts according to the specified constraints and requirements. Container orchestration software also monitors the health and performance of the containers and the cluster, and can perform actions such as restarting failed containers, scaling up or down the number of containers, load balancing the traffic among containers, and updating or rolling back the containers

The Global Container Orchestration Software Market Size was estimated at USD 325.69 million in 2023 and is projected to reach USD 552.26 million by 2029, exhibiting a CAGR of 9.20% during the forecast period.
