Abstracts

Container security scanning refers to the automated process of systematically inspecting container images and running containers for known vulnerabilities, configuration issues, malware, exposed secrets, and compliance violations before and during deployment in production environments. This practice is essential in modern DevOps and cloud-native workflows, as it integrates security into the container lifecycle—typically during build, registry, and runtime phases—to prevent exploitable weaknesses from entering live systems. Tools in this space leverage vulnerability databases, policy enforcement engines, and often integrate with CI/CD pipelines and orchestration platforms like Kubernetes to provide continuous monitoring and remediation guidance, ensuring that security is maintained without significantly impeding development velocity.

The global Container Security Scanning market size was estimated at USD 1043.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 16.80% during the forecast period.
